2. Write a precis of the following passage. Give a suitable title. 8 + 2

The last three generations have witnessed a vast increase in the size and number of large cities. Life is more exciting and more money can be earned in the cities than in villages and small towns. Hence the migration from country to city. In these migrating populations have marched the ambitious, the talented, the adventurous. For more than a century there has been a tendency for the most gifted members of small rural communities to leave home and seek fortunes in the towns. Consequently, what remains in the villages and country towns is in the nature of a residual population, weak in spirit and intellectual gifts. Why is it so hard to induce peasants and small farmers to adopt new scientific methods ? Among other reasons, almost every exceptionally intelligent child born into a rural family for a century past has taken the earliest opportunity of deserting the land for the city.

3. Read the passage carefully and answer the questions that follow :

It is thus time for the Indian industry to enter into other areas of advanced ceramics as well. Ceramics are now entering into automobile and aircraft engines; with the newer requirements for fuel efficiency, not only for economic reasons but for environmental reasons. As internal combustion engines and other energy conversion systems are likely to operate at higher and higher temperatures, ceramics have a unique advantage of heat resistance at these kinds of temperatures. Ceramics have also started competing with traditional machine tools. The cutting capability of ceramics is good for a number of applications. Ceramics can also be engineered to be biocompatible and are being used as replacements for broken bones. Some of the readers may already be having ceramic caps on their teeth. Many may not be aware of the crucial role of ceramics in the electronics industry. They form the base, called substrate, for a number of miniature electronic devices which are coated or etched on such substrates, keeping up the trends of micro-miniaturization. Many ceramic materials are crucial for advanced sensors. The tiny microphones in your tape recorders or in a collar mike have elements of ceramic in the form of piezoelectric crystals.
