TEST - II **English Language**

Q.51-65.Read the following passage carefully and answer the questions given below it. Certain words/phrases have been printed in bold to help you locate them while answering some of the questions.

A new analysis has determined that the threat of global warming can still be greatly diminished if nations cut emissions of heat-trapping greenhouse gases by 70% this century. The analysis was done by scientists at the National Center for Atmospheric Research (NCAR). While global temperatures would rise, the most dangerous potential aspects of climate change, including massive losses of Arctic sea ice and permafrost and significant sea-level rise, could be partially avoided.

"This research indicates that we can no longer avoid significant warming during this century," said NCAR scientist Warren Washington, the study paper's lead author. "But, if the world were to implement this level of emission cuts, we could stabilize the threat of climate change", he added.

Average global temperatures have warmed by close to 1 degree Celsius since the pre-industrial era. Much of the warming is due to human-produced emissions of greenhouse gases, predominantly carbon dioxide. This heat-trapping gas has increased from a pre-industrial level of about 284 parts per million (ppm) in the atmosphere to more than 380 ppm today. With research showing that additional warming of about 1 degree C may be the threshold for dangerous climate change, the European Union has called for dramatic cuts in emissions of carbon dioxide and other greenhouse gases.

To examine the impact of such cuts on the world's climate, Washington and his colleagues ran a series of global studies with the NCAR-based Community Climate System Model (CCSM). They assumed that carbon dioxide levels could be held to 450 ppm at the end of this century. In contrast, emissions are now on track to reach about 750 ppm by 2100 if unchecked. The team's results showed that if carbon dioxide were held to 450 ppm, global temperatures would increase by 0.6 degrees Celsius above current readings by the end of the century. In contrast, the study showed that temperatures would rise by almost four times that amount, to 2.2 degrees Celsius above current readings, if emissions were allowed to continue on their present course. Holding carbon dioxide levels to 45.0 ppm would .have other impacts, according to the climate modelling study.

Sea-level rise due to thermal expansion as water temperatures warmed would be 14 centimetres (about 5.5 inches) instead of 22 centimetres (8.7 inches). Also, Arctic ice in the summertime would shrink by about a quarter in volume and stabilize by 2100, as opposed to shrinking at least threequarters and continuing to melt, and Arctic warming would be reduced by almost half.

- Q.51. Why has the European Union called for dramatic cuts in carbon dioxide and greenhouse gas emissions
 - (1) As global warming is not an issue of concern.
 - (2) As the temperatures may rise almost by an additional one degree and this may lead to severe climate change.
 - (3) As the NCAR has forced the European Union to announce the cuts.
 - (4) As all the nations have decided to cut emissions of carbon dioxide.
 - (5) None of these
- Q.52. What would NOT be one of the impacts of cutting greenhouse gas emissions?
 - (1) Temperatures will stop soaring
 - (2) Ice in the Arctic sea would melt at a slower pace
 - (3) The rise in sea level would be lesser
 - (4) All of the above would be the impact
 - (5) None of these
- Q.53. What would be the impact of holding the carbon dioxide level at 450 ppm at the end of this century?
 - (A) Global temperatures would increase by 0.6 degrees Celcius.
 - (B) Arctic warming would be reduced by half.
 - (C) Thermal expansion will stop completely.
 - (1) Only (A)
 - (2) Only (A) and (B)
- (3) Only (B) and (C)

(4) All the three (A), (B) and (C)

- (5) None of these
- Q.54. What does the scientist Warren Washington mean when he says "we could stabilize the threat of climate change"?
 - (1) Climate change can be stopped completely.
 - (2) Climate change can be regularized.
 - (3) Climate change and its effects can be studied extensively.
 - (4) The ill-effects of the change in climate can be minimized.
 - (5) None of these

Q.216-220. In each of the following questions series begins with unnumbered figure on the extreme left. One and only one of. the five numbered figures in the series does not fit into the series. The two unnumbered figures one each on the extreme left and the extreme right fit into the series. You have to take as many aspects into account as possible of the figures in the series and find out the one and only one of the five numbered figures which does not fit into the series. The number of that figure is the answer.

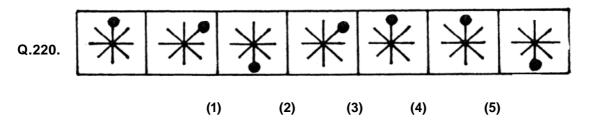

Study the following question.

In this question the number of lines in the figures goes on increasing by one from left to right. If we go by this aspect of 'number of lines' only then there is no wrong figure in the series. But if we also consider the 'manner' in which the 'number of lines' in the figures goes on increasing from left to right we come to know that the figure No.4 does **NOT** fit into the series. Therefore, 4 is the answer.

Now solve the following questions.

Q.221-225. In each of the questions given below which one of the five answer figures on the right should come after the problem figures on the left, if the sequence were continued?

PROBLEM FIGURES ANSWER FIGURES Q.221. (1) (2) (4) (5) (3) Q.222. (4) (1) (2) (3) (5) Q.223. (1) (2) (3) (4) (5) Q.224. (2) (1) (3) (4) (5) Q.225. (1) (2) (3) (4) (5)
