# FACULTY RECRUITMENT TEST <br> CATEGORY-C <br> Formal School Education/XI, XII <br> CHEMISTRY <br> PAPER - A 

Time: 60 Minutes.
Maximum Marks: 40

| Name:...................................................................................... |  |
| :---: | :---: |
| Subject:.................................................................................. | Marks: |

## Instructions:

Attempt all questions.

- This question paper has two Parts, I and II. Each question of Part I carries 2 marks and of Part II carries 5 marks.
Calculators and log tables are not permitted

## PART - I

1. $75 \%$ of 1 st order reaction was completed in 32 minutes. When was $50 \%$ of the reaction completed?
2. What is the attacking electrophile in Reimer Tiemann reaction when phenol is treated with $\mathrm{CHCl}_{3}$ \& KOH ?
3. What is the pH of $10^{-2}(\mathrm{M})$ acetic acid? pka of acetic acid $=4.74$
4. $\quad$ A halide $\mathrm{C}_{5} \mathrm{H}_{11} \mathrm{X}$ on treating with alc. KOH gives pentene -1 . What is the halide?
5. A colourless inorganic salt (A) decomposes completely at about $250^{\circ} \mathrm{C}$ to give only two products, (B) and (C), leaving no residue. The oxide (C) is a liquid at room temperature and neutral to moist litmus paper while the gas $(B)$ is a neutral oxide. White phosphorus burns in excess of $(B)$ to produce a strong white dehydrating agent. Write balanced equations for the reactions involved in the above process.
6. The standard oxidation potential of $\mathrm{Ni} / \mathrm{Ni}^{+2}$ electrode is 0.236 V . If this is combined with a hydrogen electrode in acid solution, at what pH of the solution will the measured emf be zero at $25^{\circ} \mathrm{C}$. Assume $\left[\mathrm{Ni}^{+2}\right]=1 \mathrm{M}$.
7. Element (A) burns in nitrogen to give ionic compound (B). Compound (B) reacts with water to give (C) and (D). A solution of (C) becomes milky on bubbling $\mathrm{CO}_{2}$. Identify (A), (B), (C) and (D).
8. A metal wire carries a current of 1 ampere. How many electrons pass through a point in the wire in 1 second?

## FAC-REC-CH-2

9. For the reaction, $2 \mathrm{CO}+\mathrm{O}_{2} \longrightarrow 2 \mathrm{CO}_{2} ; \Delta \mathrm{H}=-560 \mathrm{~kJ}$. Two moles of CO and one mole of $\mathrm{O}_{2}$ are taken in a container of volume 1 L . They completely form two moles of $\mathrm{CO}_{2}$, the gases deviate appreciably from ideal behaviour. If the pressure in the vessel changes from 70 to 40 atm , find the magnitude (absolute value) of $\Delta \mathrm{U}$ at 500 K .
( $1 \mathrm{~L} \mathrm{~atm}=0.1 \mathrm{~kJ}$ )
10. Arrange the following as stated
(i) n -butane, n -butanol, n -butyl chloride, isobutane in increasing order of boiling point.
(ii) benzene, toluene, methoxybenzene, chlorobenzene in increasing order of reactivity towards sulphonation with fuming sulphuric acid.

## PART - II

1. An organic compound $(A), \mathrm{C}_{4} \mathrm{H}_{9} \mathrm{Cl}$ on reacting with aqueous KOH gives $(\mathrm{B})$ and on reaction with alcoholic KOH gives $(C)$ which is also formed on passing the vapours of $(B)$ over heated copper. The compound (C) readily decolourises bromine water. Ozonolysis of (C) gives two compounds (D) and (E). Compound (D) react with $\mathrm{NH}_{2} \mathrm{OH}$ to give (F) and the compound (E) reacts with NaOH to give an alcohol $(\mathrm{G})$ and sodium salt $(\mathrm{H})$ of an acid. (D) can also be prepared from propyne on treatment with water in presence of $\mathrm{Hg}^{2+}$ and $\mathrm{H}_{2} \mathrm{SO}_{4}$. Identify $(\mathrm{A})$ to $(\mathrm{H})$ with proper reasoning.
2. Black coloured (insoluble in $\mathrm{H}_{2} \mathrm{O}$ ) solid (A) does not dissolve in dil. $\mathrm{HNO}_{3}$. Aqua regia can dissolve (A) forming (B). (B) gives yellow precipitate (C) with NaOH . (B) also gives orange precipitate (D) with KI ; (D) dissolves in excess of KI forming (E). (E) gives brown precipitate with $\mathrm{NH}_{4}^{+}$salt in presence of NaOH . (A) is precipitated if $\mathrm{H}_{2} \mathrm{~S}$ gas is passed into solution of $(B)$ in dil. HCl . Identify $(A)$ to ( E ) and explain reactions.
3. The $\mathrm{K}_{\mathrm{SP}}$ of $\mathrm{Ag}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ at $25^{\circ} \mathrm{C}$ is $1.29 \times 10^{-11}$ mole ${ }^{3} \mathrm{I}^{-3}$. A solution of $\mathrm{K}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ containing 0.152 mole in 500 mL water is shaken at $25^{\circ} \mathrm{C}$ with excess of $\mathrm{Ag}_{2} \mathrm{CO}_{3}$ till the equilibrium is reached.
$\mathrm{Ag}_{2} \mathrm{CO}_{3}+\mathrm{K}_{2} \mathrm{C}_{2} \mathrm{O}_{4} \rightleftharpoons \mathrm{Ag}_{2} \mathrm{C}_{2} \mathrm{O}_{4}+\mathrm{K}_{2} \mathrm{CO}_{3}$
At equilibrium the solution contains 0.0358 mole of $\mathrm{K}_{2} \mathrm{CO}_{3}$. Assuming degree of dissociation of $\mathrm{K}_{2} \mathrm{C}_{2} \mathrm{O}_{4}$ and $\mathrm{K}_{2} \mathrm{CO}_{3}$ to be same, calculate $\mathrm{K}_{\mathrm{SP}}$ of $\mathrm{Ag}_{2} \mathrm{CO}_{3}$.
4. $\quad{ }_{92}^{238} \mathrm{U}$ by successive radioactive decay changes to ${ }_{82}^{206} \mathrm{~Pb}$. A sample of uranium ore was analysed and found to contain 1.0 gm of ${ }^{238} \mathrm{U}$ and 0.1 gm of ${ }^{206} \mathrm{~Pb}$. Assuming that all the ${ }^{206} \mathrm{~Pb}$ has accumulated due to decay of ${ }^{238} \mathrm{U}$, find the age of the ore (half-life of ${ }^{238} \mathrm{U}=4.5 \times 10^{9}$ years).
