PHARMACEUTICAL ANALYSIS-I

(B.Pharmacy, 1st Semester, 2024)

Time : 3 Hours
Maximum Marks : 80

Note : Section A is compulsory. Attempt any Four questions from Section B and any Three questions from Section C.

Section-A Marks: 2 Each

1. (a) Differentiate between quantitative and qualitative analysis.
   (b) Define molarity and normality.
   (c) Define Lewis acid with example.
   (d) What is Buffer?

H-87
(e) A weighing bottle was found to weigh 12.7544 g on the left-hand pan and 12.7538 g on the right-hand pan. Correct the weight of the bottle for inequality of the beam arms.

(f) What is indicator error in the titration?

(g) What are mixed indicators?

(h) Define oxidising agent with examples.

(i) Explain why standard KMnO₄ solution should not be prepared by exact weighing.

(j) How are coupled reactions explained?

(k) For standardisation of thiosulphate, a chemically pure salt can act as thiosulphate solution to be titrated with iodine.

(l) Define Coprecipitation
(3)

(i) What do you understand by term unsaturated solution?

(ii) What is principle of mercurometric determination of Cl⁻?

(iii) Explain the principle of back titration.

Section-B  Marks: 5 Each

2. Write the structure formulas of both tautomeric forms of the indicator paranitrophenol. Explain the mechanisms of its colour change on the basis of the ionic chromophore theory of indicators.

3. How can the carbonate and bicarbonate contents can be determined if they are present concurrently?

4. Explain substitution method of titration of NH₄Cl with NaOH.

5. What factors determine the rate of an elimination-addition reaction?

6. What is masking? What is its significance in analysis?
8. Write a note on titrations involving sodium 6-dichlorophenol indophenol.

9. Write a note on titration curves.

10. Write a note on TGA and DTA.

(a) \[ \text{Sn}^2+ + I_2 \rightarrow \text{Sn}^4+ + 2I^- \]

(b) \[ \text{MnO}_4^- + 8H^+ + 5\text{Fe}^{2+} \rightarrow \text{Mn}^{2+} + 5\text{Fe}^{3+} + 4H_2O \]
